

Stem Cell Biology Scientist

Position @ JLABS Toronto

Job Description:

endogena therapeutics, a startup pharmaceutical company in the field of regenerative medicine through selective regulation of stem- and progenitor cells, is seeking a highly motivated stem cell biologist. The scientist will be responsible for conducting research using human iPSCs at JLABS Toronto on the topic of retinal disease modeling. The research project involves culturing and differentiating human iPSCs, characterizing molecular pathways, conducting compound screening and data analysis.

Job Requirement

A scientist with extensive experience in iPSC biology, with preference to PhD/MD (or equivalent) degree. Experience in genetic editing of human iPSCs, qRT-PCR, immunohistochemistry is required, and a preference will be given to scientists experienced in methods of global transcriptomics and advanced molecular biology assays. First author publication(s) is advantageous. The scientist will be responsible for scientific reporting.
